## The Natural Facelift: the “Quiet Lift”

As we age our skin loses elasticity, wrinkles develop and facial tissues lose youthful fullness and start to sag. This process starts to occur as early as our thirties. A facelift, one of the most commonly performed procedures today, can provide a remarkable improvement to the appearance of the face. It is the ideal treatment for correcting a sagging jaw line, falling cheeks and a blunted neckline.

Years ago, when facelifts first gained popularity, surgeons utilized methods that often left the face looking “wind-blown” or “pulled.”

Today, surgeons are trained in the most advanced and precise techniques, utilizing a different approach to facelifting. As one of the country’s most sought after surgeons, Dr. Dayan’s specialized training and double board certification in facial plastic surgery and otolaryngology (study of the ear, nose and throat) have helped him develop gentle and precise techniques that yield natural results.

Dr. Dayan has developed a conservative approach to facelifting called the “quiet lift,” which involves filling and restoring depleted areas to rejuvenate the face and project a more youthful and refreshed appearance. His experience and expertise have allowed him to focus specifically on the face, achieving natural results. His facelifting methods utilize the safest techniques, and his artistic eye and precisely skilled surgical hands leave you looking 10 to 15 years younger without anyone being able to tell that you underwent a procedure.

## Necklift

Unfortunately, having fat under the chin is often hereditary and is unaffected by diet and exercise. A neck lift can provide remarkable improvement in the appearance of this area. Patients will often combine this procedure with a facelift to achieve overall rejuvenation.
