

NON SURGICAL INJECTABLES AND LASER TREATMENTS

Botulinum Toxin

With the recent addition of Dysport® to the market, there are now two botulinum toxins available to help get rid of the wrinkles around your eyes and forehead. Botox® and Dysport® both work by relaxing the muscles that lead to those pesky lines, and both are also extremely safe options to help keep you looking refreshed. Dr. Dayan performs over 1,000 Botox® injections each year and was the only physician in Chicago to be involved in Dysport's® clinical trial. Results typically last between 3-4 months and will have you back to your busy schedule in a matter of minutes.

Fillers

As we age certain areas of our face begin to lose volume, leading to a hollowed out appearance that can make one appear older. Fillers are a great way to help restore volume and fullness to certain areas of the face and are quickly becoming the cosmetic industry's rising stars. With fillers, product can be injected in places like the cheek, nasolabial folds (the lines running from your nose to your mouth) and the lips to help provide a full, natural and youthful appearance. It is very important with fillers to have a physician who is trained in the highly specialized techniques for the various areas of the face, Dr. Dayan performs over 1,500 filler treatments a year and teaches physicians around the world his innovative and highly successful methods. Most fillers last anywhere from 6-9 months.

NON SURGICAL INJECTABLES AND LASER TREATMENTS

Laser Skin Rejuvenation

From skin tightening and wrinkle reduction, to brown spot and broken blood vessel removal, lasers are available to help treat a variety of skin conditions and types. Depending on your desired outcome and your skin type Dr. Dayan or Michelle will go over what laser treatment would be the best fit for you and what you can expect. With most laser treatments you can expect to be slightly red following your treatment, but most people find it easy to soon get back into their daily routines. This is a great option for taking years off of your appearance.

Laser Hair Removal

Shaving and waxing can so often be ineffective, painful and painfully temporary. Laser hair removal is a great way of permanently reducing the amount of hair, whether it be on your legs, underarms, bikini area or elsewhere. Laser hair removal works by targeting the melanin within the hair follicle; a series of several treatments may be needed. Following your laser hair removal treatment you may be slightly red, but this is usually minimal and gone within a few hours. Laser hair removal helps take off that unwanted hair and add on time to your day.
